LED Complexity
ART385

For this assignment, we are required to develop a complex function that combines both switches and LEDs in order to make the LED light up in an interesting way.

I am really struggling with both the hardware and coding part of this assignment. I am slowly beginning to understand the hardware part, however the coding is where I am now having issues. I wanted to be able to switch the lights between three different colors (Red, Green, Blue) and was able to have the LED light up as red, but not change to other colors. I tried to look up code that could help me but I think it is confusing me more. Overall, I am beginning to grasp the material but need more help with the coding.
